Do you know what that is? That my friends is a grease stoppage in a p-trap. Grease clogged pipes and stoppages are pretty common. That's why friends don't let friends put grease down their drain line. Almost daily we clear a grease stoppage for clients and I am here to educate you that grease and plumbing don't mix. Grease will always win. There seems to be a rumor spreading that you can stick grease down your line if you run hot water with it...FALSE! Running hot water behind grease only sends it further down your pipe extending the stoppage even further. The grease slowly coats your pipe over time with layers and layers of hot grease that cooled and coated the sides of your pipe. This photo is the cleanest, internet friendly photo we could come up with to demonstrate the power of grease and its ability to completely plug your drain line. Share this message with a friend, share it on social media, save the world from grease stoppages!
